PathFinder

A source-linked learning plan for the next career decision.

Rising Rookies	Domain 1 / SDG 4: Quality Education
Team	LIN ZIRUI / Xiamen University Malaysia / 5 members

Review draft. Major AI-assisted development; registered-team adaptation and sign-off pending.

Which skill should a learner study next?

The first decision is often unclear.

Who	University and TVET learners, fresh graduates and career switchers exploring technical work.
Problem	A skills list does not explain which role fits, which foundation is missing or why a course is relevant.
Scope	Five curated role pathways. International job signals, with a clearly stated Europe-heavy sampling limit.

Source: Domain 1 brief, pp. 1-3. No Malaysian employment estimate is derived from our feed.

One journey from profile to next step

A working UI connects evidence to action.

1. Profile	Use a synthetic persona, select skills and weekly study time.
2. Evidence and match	Refresh dated feeds, inspect score components and select a target role.
3. Learning and purpose	Follow ordered resources, track milestones and inspect SDG rationale.

Live prototype: https://futurepath-workforce-radar.spryhaven13.chatgpt.site

Public signals remain traceable

News and job evidence stay separate.

Job channel	Arbeitnow public title/tag/date/link metadata. Europe-heavy sample.
AI channel	HN Search by Algolia. AI-discussion proxy, not verified research or job demand.
Direction and fallback	Compare date groups within one source, minimum 5 records each. Manual refresh or dated JSON import.

Source links: arbeitnow.com/blog/job-board-api; hn.algolia.com/api. Public access does not settle reuse rights.

Every score exposes its assumptions

A match index out of 100 supports exploration.

Moderate	65 points skill coverage + 20 interest alignment + 15 signal relevance.
Fast	55 points weighted skills + 20 interests + 25 signals. AI/automation/ethics priority = 1.5.
Interpretation	Source-normalized keyword shares inform the signal component. Scores are not hiring probabilities.

Current runtime is a deterministic baseline. No trained forecasting model or LLM is deployed.

A pathway starts with missing foundations

Time estimates follow the learner’s weekly budget.

Example	Synthetic Alex: Python, Circuit analysis, Communication. Target: Automation Engineer.
Gap and plan	Automation foundation: 32 estimated hours. At 5 hours/week: ceiling(32/5) = 7 weeks.
Resource and control	Arduino Learn plus an introductory control simulation. Learner chooses whether to follow it.

Resource: docs.arduino.cc/learn/. Estimate is project-authored introductory study time, not a course duration or job qualification.

SDG 4 gives the plan a measurable purpose

Relevant skills and affordable learning are the primary contribution.

Targets	4.4 technical and vocational skills for employment. 4.3 access to affordable learning.
Constructed baseline	0/5 complete exported plans for a defined profile-only comparator. No human study or employment effect measured.
Phase 2 target	At least 4/5 synthetic journeys pass the acceptance checklist (80%). Pilot usability target: 80% finish within 5 minutes, untested.

Sources: sdgs.un.org/goals/goal4; Domain 1 brief. Supporting SDGs depend on the chosen role. No carbon savings claimed.

The prototype runs without a model backend

The team can inspect and reproduce the logic.

Implemented	Static HTML/CSS/JavaScript, testable core module, two public feeds, localStorage, JSON export.
Verification	Core checks cover evidence/scenario effects, gaps, source separation, safe imports, study order and score bounds.
Next technical step	Evaluate a constrained skill-classification model and Malaysian source coverage. Neither is implemented.

Development: major OpenAI ChatGPT/Codex assistance. Team ownership, explanation and practical review remain mandatory.

Readiness depends on genuine team evidence

The current bundle is an honest review draft.

Required before submission	Actual team-account Replit use/proof; public GitHub, Apache 2.0 and committee access; workshop/IP confirmations; phone and signature.
Questions to resolve	RunPod wording conflict (conditional GPU rule vs sample README). Whether the deterministic baseline meets AI-powered expectations.
Deadline	25 October 2026, 07:59:59 MYT. Record a 5-7 minute YouTube pitch with a functioning prototype demo.
