RunPod applicability statement

Evidence status: review draft; unresolved fields are not certified.

Actual observed usage: NONE

PathFinder v2 runs deterministic JavaScript in the browser. It performs no GPU training, fine-tuning, inference or self-hosted model computation. No RunPod account, credit, pod or endpoint was used or evidenced. This document is an applicability statement, not proof of consumption.

Conflicting wording to resolve

Orientation PDF p.29 says GPU training, fine-tuning or running a model on a GPU must use RunPod, with proof showing pod/endpoint, GPU type and runtime. The supplied GitHub sample README labels RunPod use Required and includes a Runpod_POU PDF. The sample is not silently treated as a waiver or as a universal GPU requirement. Terms & Conditions prevail, but their text was not supplied.

Required team action

Ask the organizer in official Discord whether a CPU/browser-only deterministic baseline may mark RunPod Not applicable. Retain the written response and cite it here. Status: PENDING clarification. If GPU work is later added, use RunPod and replace this page with real pod/endpoint ID, GPU type, runtime, use dates and appropriate evidence, with all credentials removed.

Disclosure consistency

Technical Tools Declaration: 3.2, 4.1 and 5 record no GPU/model usage. No US$25 credit consumption or sponsor API is claimed. This statement does not settle whether the deterministic baseline meets the Domain 1 AI-powered requirement; that separate product gap is disclosed in the proposal and pitch.
